

**Amendments to the Specification**

**Page 15, the third full paragraph, lines 10 to 17, replace the paragraph with:**

Signals are received by either of the receiving antenna 2 or 3 selected by the antenna switch 4 according to whether or not the antenna satisfies a predetermined receiving condition. This antenna switch 4 is controlled by the antenna switch switchover signal AS output from the ~~gain-control circuit 4927~~. The received signal is amplified by the LNA 9, which is a low noise amplifier, then converted to an intermediate frequency one by the first mixer 10.
